DermaCare AI

AI-Assisted Skin Analysis Report

User : Meet

Prediction : Acne

Confidence : 99.59%

Description :

Acne is a common skin condition that can occur when hair follicles become clogged with oil and dead skin cells.

Medicine / Treatment Information :

Treatment depends on the type and severity of acne. Products containing ingredients such as benzoyl peroxide or salicylic acid may be used in some cases. Consult a healthcare professional for appropriate treatment.

General Care / Home Remedy :

Gently clean the affected area, avoid squeezing pimples, and use non-comedogenic skincare products.

Doctor Advice :

Consult a dermatologist if acne is severe, painful, persistent, or causing scarring.

Combined AI Analysis

Final Assessment :

Inconclusive

Image & Symptoms Match :

MISMATCH

Combined Confidence :

Low

AI Assessment :

There is a clear mismatch between the image model prediction (Acne) and the user-reported symptoms (red, itchy patches on the hands, suggesting eczema or contact dermatitis). Acne primarily affects areas with high oil gland density like the face, chest, or back, whereas itchy patches

on the hands are characteristic of dermatitis. Because these sources conflict significantly, the overall assessment is inconclusive.

Recommended Care :

Moisturize your hands frequently using thick, fragrance-free creams or ointments. Wash hands with lukewarm water and mild, non-soap cleansers, and wear protective gloves during household chores or when exposed to harsh chemicals.

Medicine Information :

General information: Mild over-the-counter topical hydrocortisone cream and oral antihistamines may help relieve itching and mild inflammation temporarily. Always speak with a doctor or pharmacist before using new medications.

Doctor Advice :

Due to the conflicting findings between the visual assessment and symptom profile, an in-person evaluation by a dermatologist or healthcare professional is strongly recommended for an accurate diagnosis and treatment plan.
