AI-Assisted Skin Analysis Report

User : Meet

Image Analysis

Prediction : Acne

Confidence : 99.59%

Reported Symptoms / Problem

red, itchy patches on my hands

Combined AI Analysis

Final Assessment : Inconclusive

Image & Symptoms Match : MISMATCH

Combined Confidence : Low

AI Assessment

There is a significant conflict between the image prediction and the reported symptoms. The AI image model suggested Acne, whereas the reported symptoms describe red, itchy patches on the hands, which is characteristic of hand eczema or contact dermatitis. Acne typically affects the face, chest, or back, making an acne diagnosis on the hands highly unlikely.

Recommended Care

Wash hands with lukewarm water and mild, soap-free cleansers. Apply a thick, fragrance-free moisturizing cream or ointment immediately after washing. Wear protective gloves when doing dishes or handling household chemicals.

Combined Medicine Information

Over-the-counter mild hydrocortisone cream may provide temporary relief for localized itching from hand dermatitis, but it should be used cautiously and as general information only.

Combined Doctor Advice

Given the clear mismatch between the image analysis and your reported symptoms, a professional evaluation by a dermatologist is strongly recommended for an accurate diagnosis and appropriate treatment plan.

Disease Information

Acne is a common skin condition that can occur when hair follicles become clogged with oil and dead skin cells.

Medicine / Treatment Information

Treatment depends on the type and severity of acne. Products containing ingredients such as benzoyl peroxide or salicylic acid may be used in some cases. Consult a healthcare professional for appropriate treatment.

General Care / Home Remedy

Gently clean the affected area, avoid squeezing pimples, and use non-comedogenic skincare products.

Doctor Advice

Consult a dermatologist if acne is severe, painful, persistent, or causing scarring.
