Image Analysis

Prediction : Acne

Confidence : 99.59%

Reported Symptoms / Problem

red, itchy patches on my hands

Combined AI Analysis

Final Assessment : Inconclusive

Image & Symptoms Match : MISMATCH

Combined Confidence : Low

AI Assessment

There is a clear mismatch between the image model's prediction (Acne) and the reported symptoms and body location (Hand eczema / Contact dermatitis). Acne typically affects the face, chest, shoulders, or back and presents with pimples or comedones. In contrast, symptoms on the hands associated with frequent handwashing and harsh soaps point toward localized dermatitis or eczema.

Recommended Care

Practice gentle skin hygiene on the hands. Wash with lukewarm water and mild, fragrance-free soap substitutes. Apply a thick moisturizing ointment or cream immediately after washing to help repair the skin barrier.

Combined Medicine Information

Do not apply acne medications to the hands, as they can cause further dryness and irritation. A mild over-the-counter hydrocortisone cream may temporarily soothe itching, but discuss medication use with a healthcare professional first.

Combined Doctor Advice

Consult a dermatologist or general physician for an accurate in-person physical evaluation and a tailored management plan for your hand skin symptoms.

Disease Information

Acne is a common skin condition that can occur when hair follicles become clogged with oil and dead skin cells.

Medicine / Treatment Information

Treatment depends on the type and severity of acne. Products containing ingredients such as benzoyl peroxide or salicylic acid may be used in some cases. Consult a healthcare professional for appropriate treatment.

General Care / Home Remedy

Gently clean the affected area, avoid squeezing pimples, and use non-comedogenic skincare products.

Doctor Advice

Consult a dermatologist if acne is severe, painful, persistent, or causing scarring.
